Claim

1. A plant support bracket comprising a metal or plantis bracket of any required length which has a notched straight edge at one end to allow for tying or fixing of a plant and a sharp fulcrum point opposing a support point formed in the opposite end which when attached to an upright stake will self lock on to the stake and project in a horizontal direction to provide support for the plant.

## AUSTRALIA Patents Act 1990

# Complete Specification Petty Patent

Invention Title
Plant Support Bracket

The following statement is a full description of this invention, including the best method of performing known to me:-

### 18

The invention relates to improvements in the means of supporting plants. Many plants require some form of artificial support at various stages of growth. This can be accomplished by tying or otherwise fixing the plant to an upright stake or rod embedded in the ground adjacent to the plant. However, as the plant matures, supporting the lateral branches by using this method can prove to be difficult.

The present invention overcomes the problem by providing an adjustable bracket that can be attached to an upright stake or rod at one end so that it projects horizontally from the upright to provide a direct means of supporting the lateral branches of the plant by tying or fixing them to the opposite end.

While some devices exist that could be adapted to serve this purpose they are generally unsuitable or impractical for use in the circumstances that prevail in the home garden.

A description of the Plant Support Bracket, hereto referred to as the bracket(s) according to this invention, and the best method of performing it, can be more clearly defined by referring to the accompanying drawings.

In the drawings:

Fig 1 is an isometric view of the bracket (1) of Claim 1 which is formed at one end, hereto referred to as the pivot end, to provide a fulcrum point (2) and a support point (3). The opposite end of the

bracket is shown to have a notched, straight edge (4).

Fig 2 shows how the bracket may be attached to an upright stake or rod (5), hereto referred to as the upright, so that the fulcrum point (2) engages one side of the upright and the support point (3) engages the opposite side. The weight of the bracket acts on the opposing pivot points to create a self-locking effect on the upright, thereby holding the bracket in a horizontal position so that the lateral branches of the plant (6) can be directly supported at the notched end by use of ties (7), (8) or other means of attachment.

Fig 3 shows the bracket (1) of Claim 2 that has a fulcrum point (2) that is formed to project at a right angle to the main body of the bracket and that is that same width as the support point (3).

Fig 4 shows how, in the event of a plant having a robust main stem, the bracket can be attached directly to the main stem of the plant to support and train lateral branches.

Fig 5 shows how several brackets can be attached to a single upright and may project horizontally in any direction from the upright.

Fig 6 shows how the bracket can be attached to the upright in a lateral direction to avoid interference with other brackets already in place on the upright.

Fig 7 shows an adaptation of the bracket of Claim 1 whereby the main body of the bracket has an adverse angle of 135 degrees formed at a point adjacent to the fulcrum point so that the support point (3) is realigned in such a way that it and the fulcrum point (2) represent opposing ninety degree angles which will allow the bracket to grip the diagonal corners of a square upright (Fig 8) or the periphery of a round upright (Fig 9).

As the plant grows vertical adjustment of the bracket can be made by lifting the bracket at the fulcrum point to the desired position and allowing it to self lock on the upright when released, while still

STRALLY Z

.

30

maintaining support for the plant.

The bracket may be made of any suitable material such as metal explante and may be any required length.

The bracket does not need to be a precise fit to maintain its position on the upright which may be any suitable stake or rod such as a common garden stake.

The upright is therefore not claimed to be part of the invention.

- 1. A plant support bracket comprising a metal or plactical pracket of any required length which has a notched straight edge at one end to allow for tying or fixing of a plant and a sharp fulcrum point opposing a support point formed in the opposite end which when attached to an upright stake will self lock on to the stake and project in a horizontal direction to provide support for the plant.
- 2. The plant support bracket of Claim 1 that has a fulcrum point that is formed to project at a right angle to the main body of the bracket and which is the same width as the support point.
- 3. The plant support bracket of Claim 1 which has an adverse angle of 135 degrees formed at a point adjacent to the fulcrum point so that the support point is constructed in such a way that it and the fulcrum point represent opposing ninety degree angles.

Garry Alan Foster

28 TH October 1996

### **ABSTRACT**

A device to assist in the support of plants is disclosed.

The device consists of a metal or plastic bracket 1 with a fulcrum point 2 and an opposing support point 3 formed in one end to provide a pivot and a notched straight edge 4 at the opposite end.

When the pivotal end of the bracket is attached to an upright stake 5 and a plant 6 is tied or fixed to the notched straight edge 4, the weight of the bracket and the plant exerts pressure on the opposing pivot points to provide a locking effect on the stake holding it in a horizontal position to provide support for the plant.

The notched straight edge of the bracket provides non slip points for securing the plant to the bracket.

F16. 1.

FIG. 2.
